WEEK 11:

Ex. No. : 11.1 Date: 6.6.2024

Register No.: 231501177 Name: UMESH SARATHY S K

1.

Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

Input Format: A single line input representing the user's age.

Output Format: Print a message based on the age or an error if the input is invalid.

For example:

| Input | Result |
|------------|----------------------------------|
| twent y | Error: Please enter a valid age. |
| 25 | You are 25 years old. |
| -1 | Error: Please enter a valid age. |

```
try:
    a=input()
    if(len(a)==0):
        print("Error: Please enter a valid age.")
    elif a.isnumeric():
        print("You are",a,"years old.")
    else:
```

print("Error: Please enter a valid age.")
except:

print("Error: Please enter a valid age.")

OUTOUT:

| Input | Expected | Got |
|------------|----------------------------------|----------------------------------|
| twent y | Error: Please enter a valid age. | Error: Please enter a valid age. |
| 25 | You are 25 years old. | You are 25 years old. |
| -1 | Error: Please enter a valid age. | Error: Please enter a valid age. |
| 150 | You are 150 years old. | You are 150 years old. |
| | Error: Please enter a valid age. | Error: Please enter a valid age. |

Passed all tests!

Correct

2.

Ex. No. : 11.2 Date: 6.6.2024

Register No.: 231501177 Name: UMESH SARATHY S K

Problem Description:

Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

Input Format:

A single line input representing the user's age.

Output Format:

Print a message based on the age or an error if the input is invalid.

For example:

| Input | Result | |
|-------|---|--|
| 25 | You are 25 years old. Error: Please enter a valid age. | |
| rec | | |

| Input | Result |
|-------|----------------------------------|
| -5 | Error: Please enter a valid age. |

```
try:
    a=input()
    if(len(a)==0):
        print("Error: Please enter a valid age.")
    elif a.isnumeric():
        print("You are",a,"years old.")
    else:
        print("Error: Please enter a valid age.")
except:
    print("Error: Please enter a valid age.")
```

OUTPUT:

| Inpu t | Expected | Got |
|-----------|----------------------------------|----------------------------------|
| 25 | You are 25 years old. | You are 25 years old. |
| rec | Error: Please enter a valid age. | Error: Please enter a valid age. |
| !@# | Error: Please enter a valid age. | Error: Please enter a valid age. |

Passed all tests!

Correct

3.

Ex. No. : 11.3 Date: 6.6.2024

Register No.: 231501177 Name: UMESH SARATHY S K

Problem Description:

Write a Python script that asks the user to enter a number within a specified range (e.g., 1 to 100). Handle exceptions for invalid inputs and out-of-range numbers.

Input Format:

| User inputs a number. | | |
|-----------------------|--|--|
| Output Format: | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

Confirm the input or print an error message if it's invalid or out of range.

For example:

| Input | Result | |
|-------|------------------------------------|--|
| 1 | Valid input. | |
| 101 | Error: Number out of allowed range | |
| rec | Error: invalid literal for int() | |

```
def main():
    min_range = 1
    max_range = 100

try:
    num = int(input())
    if num < min_range or num > max_range:
        print("Error: Number out of allowed range")
    else:
        print("Valid input.")
    except ValueError:
    print("Error: invalid literal for int()")
```

OUTPUT:

if __name__ == "__main__":

| Inpu t | Expected | Got |
|-----------|--------------|--------------|
| 1 | Valid input. | Valid input. |

| Inpu t | Expected | Got |
|-----------|------------------------------------|------------------------------------|
| 100 | Valid input. | Valid input. |
| 101 | Error: Number out of allowed range | Error: Number out of allowed range |

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

4.

Ex. No. : 11.4 Date: 6.6.2024

Register No.: 231501177 Name: UMESH SARATHY S K

Develop a Python program that safely performs division between two numbers provided by the user. Handle exceptions like division by zero and non-numeric inputs.

Input Format: Two lines of input, each containing a number.

Output Format: Print the result of the division or an error message if an exception occurs.

For example:

| Input | Result | |
|---------|---|--|
| 10 2 | 5.0 | |
| 10 0 | Error: Cannot divide or modulo by zero. | |

| Input | Result | |
|----------|------------------------------------|--|
| ten 5 | Error: Non-numeric input provided. | |

```
def main():
    try:
        num1 = float(input())
        num2 = float(input())

        division_result = num1 / num2
        modulo_result = num1 % num2

        print(division_result)

        except ValueError:
        print("Error: Non-numeric input provided.")
        except ZeroDivisionError:
        print("Error: Cannot divide or modulo by zero.")

if __name__ == "__main__":
        main()
```

OUTPUT:

| Inpu t | Expected | Got |
|-----------|---|---|
| 10 2 | 5.0 | 5.0 |
| 10 | Error: Cannot divide or modulo by zero. | Error: Cannot divide or modulo by zero. |
| ten 5 | Error: Non-numeric input provided. | Error: Non-numeric input provided. |

Correct

5.

Ex. No. : 11.5 Date: 6.6.2024

Register No.: 231501177 Name: UMESH SARATHY S K

Problem Description:

Develop a Python program that safely calculates the square root of a number provided by the user. Handle exceptions for negative inputs and non-numeric inputs.

Input Format:

User inputs a number.

Output Format:

Print the square root of the number or an error message if an exception occurs.

For example:

| Inpu t | Result |
|-----------|---|
| 16 | The square root of 16.0 is 4.00 |
| -4 | Error: Cannot calculate the square root of a negative number. |
| rec | Error: could not convert string to float |

try:

```
a=float(input())
if(a<0):
    print("Error: Cannot calculate the square root of a negative number.")
else:
    print("The square root of",a,"is {:.2f}".format(a**0.5))
except:
    print("Error: could not convert string to float")</pre>
```

OUTPUT:
